Hey guys,

We've completed the testing.
The feedback is below. Please review and let me know if you have any questions.

#1 -
ADMIN panel minor bug -
If you change the dropboxes to Yes, and paste the ID on the field, then hit save - it shows a message saying you can't save without an ID.
If you paste the ID, then save (without changing enable to Yes) - then it saves, then you can change enabled to Yes and successfully save.
Please implement the canEnable function so it also checks for POST data and not only existing configuration, so the module can decide whether it should be enabled or not more wisely.
That said, upon setting a Koemei UUID you make an API call to Koemei service, and it is possible that this will fail (in case of a wrong UUID), in which case (due to order of things) you wouldn't reject the enable, but the result would be bad configuration.
A possible 'easy' fix to this issue will be to add description that instructs the user to set the UUID, save and only then click Enable.

#2 -
Minor, On all pages, I'm seeing the following error on the console:
```
    Uncaught ReferenceError: kw_in_edit is not defined  koemei-adaptor.js:47
```

It doesn't seem to affect anything though they should probably check if the in-edit mode and only then inject that code to the page.

#3 -
UI Bug, on the Transcript view in entry playback page, the "Edit transcript" button is cut-off:

This seems to be the result of your own CSS code (/koemei/asset/koemei-style.css line 15) - .tabActionLinks has a CSS rule for - margin-top: -10px; - if removed, this is resolved.

#4 - Major
On a page with a long video (40min +) -
If you open the Transcript tab, and hit play - very quickly you'll notice the page becomes extremely slow and the video stutters playback. As soon as you'll change back to the Comments tab, the page is released and video playback resumes normal behavior.. changing to the Transcript again, and you'll see how slow it is... It is consistent.
My guess is that the transcript tracking feature (the words highlighting) is not very efficient, so with longer videos (this is a 1 hour video), the script requires too much resources.

Please review and fix so we can have a final version on Production.

Thanks!
